

Azure-native backup and recovery

What's new in V4?

NEW Veeam® Backup for Microsoft Azure v4 brings new features and enhancements that expand native support for Azure workloads, enhance security measures, streamline usability and more!

The following is a list of the new features and enhancements that were added to the latest release, which is available in both Veeam Backup for Microsoft Azure v4 and Veeam Backup & Replication™.

Azure Files support

Veeam Backup for Microsoft Azure now includes comprehensive backup and recovery support for Azure Files. Powerful, policy-based automation simplifies protection with wizard driven file-level recoveries either in-place or at a new location. Built-in file level indexing options enable quick and easy file recoveries from any restore point in just seconds.

Private network deployment

Veeam Backup for Microsoft Azure can now be deployed in networks with no public access to endpoints and storage accounts. This better meets the requirements of security departments and internal regulations where this is required.

Configuration backup and restore

Veeam Backup for Microsoft Azure can now create a backup of the full appliance configuration on a backup repository. This allows for easy recovery when you need to redeploy the Veeam backup appliance from scratch, as does this update's quick migration procedures, testing and more.

Other enhancements

UI and UX

- **NEW overview dashboard:** The updated overview dashboard gives a modern insight into your backup infrastructure with an overview of sessions, policy details, protected workloads and more!

Backup and recovery

- **Worker redesign:** It is now possible to use specific machine configurations for the backup and archive process, including per-region control, and the ability to reduce costs while improving backup and restore operations.
- **Health check for backups:** A new health check feature has been added to the policy wizard for instances, which allows you to perform additional health checks based on your needs.

Integration with Veeam Backup & Replication*

- **Visibility into new workloads:** Azure Files backups are now also visible in the backup console. This allows backup administrators to have a single data protection view across their on-premises and public cloud infrastructures.
- **Configuration backup and restore:** Quickly create a configuration backup of the Veeam Backup for Microsoft Azure appliance. This allows for an easy recovery when you're required to redeploy the Veeam Backup for Microsoft Azure appliance from scratch, as does this update's quick migration procedures, testing and more.
