

NEW Veeam Availability Orchestrator

Disaster recovery orchestration for the Enterprise

Enterprises face serious, and often complicated, challenges when it comes to the planning, preparation and execution of Always-On™ operations, no matter the scenario and with little time to spare. Mitigating risk against natural and man-made disasters — intentional or accidental — and ensuring business continuity is paramount to the organization's strategy and success. Manual tasks threaten data center resiliency and business continuity because they are difficult to document, error-prone and do not scale with the exponential growth of VMs, applications and end users.

NEW Veeam® Availability Orchestrator, built specifically for the enterprise, equips organizations with a disaster recovery (DR) orchestration engine for enterprise-scale management and control of Veeam Backup & Replication™ or Veeam Availability Suite™, enabling your business to:

- **Satisfy compliance requirements** with template-based dynamic documentation that make it easy to build and update DR plans as the virtual environment changes
- **Prove recoverability at any time** through both automated and manual plan testing and readiness checks that have zero-impact to the production environment
- **Ensure IT service continuity** through the reliable execution of multi-site DR failover and failback, including service and application verification

Dynamic Documents

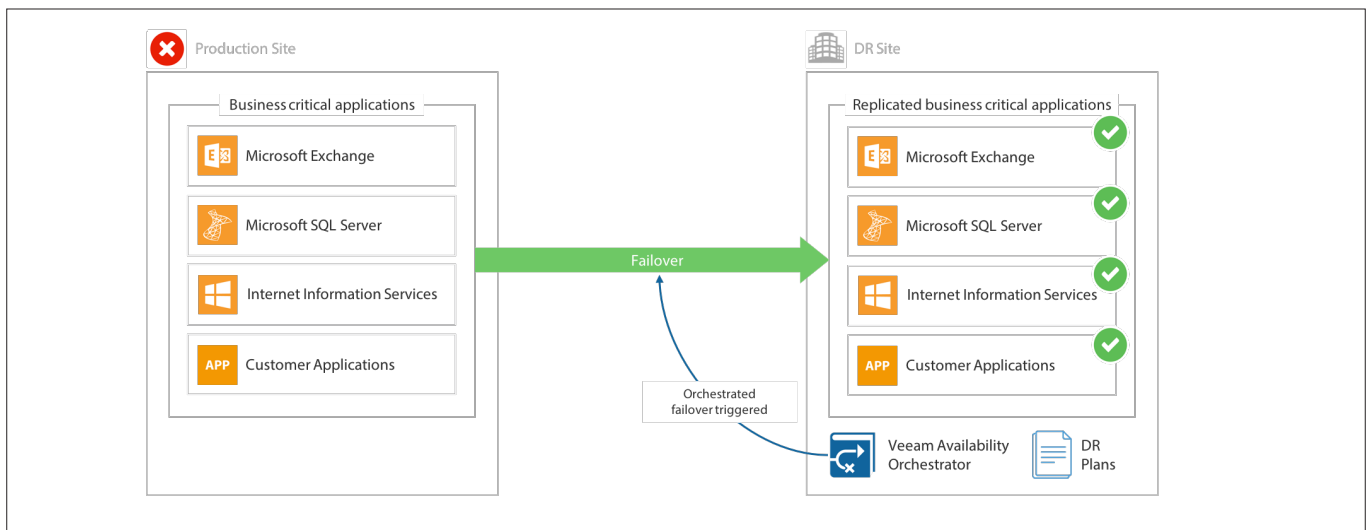

Meet documentation needs for legal requirements, compliance audits, and your technical libraries with DR documentation that is automatically updated and republished as the virtual environment changes.

Automated Tests

Proven recoverability through automated DR plan testing and readiness checks with zero-impact to production systems, avoiding expensive manual processes.

Reliable Recovery

Ensure IT service continuity and minimize service disruption through the failover and failback of multi-site DR plans for planned migrations, disaster avoidance and disaster recovery.
